Software Engineer – Distributed Systems & High-Throughput Services

Nigeria · Remote (GMT+1/CET/BST)

Experience

Thena thena.fi · 02/2024 – 03/2024 · Remote

Contract Backend Engineer — *TypeScript, Postgres, Solidity*

- Designed and shipped a greenfield wallet-based authentication protocol for the Arena product, taken from design to production.
- Diagnosed and resolved a critical frontend performance regression, measurably reducing user drop-off.

ZERO Labs Ltd github.com/s3ndotxyz/runtime · 2024 – 2025 · Hybrid

Co-Founder & Core Engineer — *Rust, Intel SGX TEEs, Nix, Linux*

- Co-designed and engineered Slipstream, a stateless backend runtime deployed inside Intel SGX Trusted Execution Environments, serving confidential-compute workloads for external users.
- Designed high-throughput memory isolation interfaces between untrusted and trusted execution contexts with minimal overhead.

Systems Projects & Open Source Contributions

Porter github.com/notxorand/porter · 2026 – Present

Author — *Rust, Linux kernel networking (SCM_RIGHTS, kTLS)*

- Built a proof-of-concept for migrating live TCP connections – including active TLS sessions – between processes during redeployment, using `SCM_RIGHTS` fd-passing so an old and new process exchange ownership of open sockets without dropping them.
- Integrated kTLS to move negotiated session keys out of process memory and into the kernel, making TLS-terminated connections fd-passable the same way plain TCP connections are – the same class of problem production L4/L7 proxies face during blue-green deploys.

Slung slung.tech · 2026 – Present

Founder — *Zig, Nix, Go, Rust, WebAssembly*

- Built a rules engine ingesting live changes from HTTP and WebSocket with other sources such as Postgres, Kafka, and NATS currently WIP, routing each update only to the rules it affects instead of recomputing on every change.
- Embedded WASM runtime so rule logic runs unmodified across services and deployments; shipped Rust and Go SDKs for integration.

Fawna github.com/notxorand/fawna · 2026 – Present

Author — *Zig, Nix*

- Built a time-series storage engine handling 6M writes/sec on commodity hardware, with range queries returning in 5–6ms across million-point windows.
- Cut on-disk storage to roughly 9 bytes/point using Gorilla-style delta compression and custom bloom filters; extracted into a standalone, embeddable library.

ZIO github.com/lalinsky/zio · 2026 – Present

Open Source Contributor — *Zig, io_uring*

- Designed and implemented a work-stealing scheduler for zio's executor pool, using an atomic *idle_mask* and single-searcher coordination to guarantee no lost wakeups and no duplicate concurrent searches under concurrent park/steal/push races.
- Added support for io_uring ATTACH_WQ so multiple rings share one IO work queue, reducing per-connection kernel overhead – directly relevant to high-concurrency API servers.

Technical Skills

Backend & Data: Postgres, Kafka, NATS, SQL, REST API design, WebAssembly, Docker, RabbitMQ

Languages: Rust, Zig, Go, TypeScript, SQL

Systems & Tooling: Intel SGX TEEs, Nix, NixOS (Linux), Git, Vue, LaTeX

Spoken Languages: English (Native), French (Beginner)

Education

University of Benin 2024 – Present (Expected 2029)

Bachelor of Engineering (B.Eng.) in Mechatronics Engineering — *Full-time*

- All professional and open-source work listed above was completed concurrently with full-time study.
