Systems Engineering Experience

Slung

Core Maintainer & Co-Author

slung.tech · 2026 – Present

Open Source

- Designed and implemented an ontology-driven compute engine built on an Entity Component System (ECS) model, where data sources are first-class entities and rules fire automatically as component facts change.
- Engineered implicit orchestration via reactive fact propagation: dirty components trigger rule re-evaluation and cascade updates across the entire system without explicit wiring.
- Developed a compiler pipeline that translates rules down to WebAssembly targets for language-agnostic, edge-deployable execution.
- Engineered the low-latency execution host in Zig from scratch and published the official Rust SDK to docs.rs/slung; ships as a lightweight single binary deployable anywhere.

Fawna

Author

github.com/notxorand/fawna · 2026 – Present

Open Source

- Extracted and open-sourced the TSDB engine from a previous version of Slung (see the work tree: [here](#)) as a standalone embeddable library written entirely in Zig.
- Achieves a sustained ingestion throughput of 6M write operations per second on commodity hardware, with range queries resolving in 5–6ms over 1M-point windows.
- Optimised on-disk layout to 9.13 bytes/point using Gorilla-style delta compression and custom bloom filters.

ZERO Labs Ltd

Co-Founder & Core Engineer

github.com/s3ndotxyz · 2024 – 2025

Remote

- Co-designed and engineered Slipstream, a stateless, serverless runtime inside Intel SGX Trusted Execution Environments (TEEs) in Rust.
- Architected hardware-isolated compute boundaries to enforce strict zero-trust execution guarantees across multi-tenant workloads.
- Designed high-throughput memory isolation interfaces with zero runtime overhead.

The Forge

Co-Author

github.com/0xZeroLabs/the-forge · 2024

Open Source

- Built an EigenLayer Actively Validated Service (AVS) in Rust and Solidity to register Web2 sessions as verifiable IP on Story Protocol.
- Used SP1 zkVM to compile execution traces into zero-knowledge (ZK) proofs for trustless on-chain verification.
- Integrated TLSNotary to cryptographically extract HTTP session transcripts without exposing underlying private data.

Other Experience

Thena.fi

Contract Backend Engineer

02/2024 – 03/2024

Remote

- Designed and shipped a greenfield wallet-based authentication protocol for the Arena product line.
- Diagnosed and resolved a critical performance regression on the frontend layer, measurably reducing user drop-off.

Hyli

Core Contributor

github.com/hyli-org/hyli · 2024 – 2025

Open Source

- Contributed low-level code to expose granular transactional and settlement failure indicators at the protocol layer.
- Overhauled the structured logger for improved observability and resolved several complex multi-threaded bugs.

Technical Skills

Systems & Architecture: Rust, Zig, Go, WebAssembly, Intel SGX TEEs, Docker, Nix, NixOS (Linux)

Web & Tooling: TypeScript, Vue, Git, L^AT_EX

Spoken Languages: English (Native), German (Intermediate), French (Beginner)

Education

University of Benin

Bachelor of Engineering (B.Eng.) in Mechatronics Engineering

2024 – Present

Hybrid
