Remote (GMT+1/CET/BST) · Open to Relocation

Open Source (Backend & Distributed Systems)

Fawna

github.com/notxorand/fawna · 2026 – Present

Author

Open Source

Tech: Zig

- Built a time-series storage engine handling 6M writes/sec on commodity hardware, with range queries returning in 5–6ms across million-point windows – a persistence layer built for the write-heavy, latency-sensitive access patterns backend services depend on.
- Cut on-disk storage cost to roughly 9 bytes/point using Gorilla-style delta compression and custom bloom filters; extracted into a standalone, embeddable library.

Slung

slung.tech · 2026 – Present

Author

Open Source

Tech: Zig, Go, Rust, WebAssembly, Postgres, Kafka, NATS

- Built a rules engine that ingests changes from Postgres, Kafka, NATS, and HTTP sources and routes each update only to the specific rules affected by it, avoiding full re-computation on every change – the same “route only what changed” pattern used in cache invalidation and event-driven backend architectures.
- Compile modules to WebAssembly so the same rule logic runs unmodified across services and deployments; shipped an accompanying [Rust](#) and [Go](#) SDKs.

ZIO

github.com/lalinsky/zio · 2026 – Present

Open Source Contributor

Open Source

Tech: Zig, io_uring

- Designed and implemented a work-stealing scheduler for zio’s executor pool, introducing atomic *idle_mask* and single-searcher coordination to guarantee wake correctness (no lost wakeups, no duplicate concurrent searches) under concurrent park/steal/push races – the same class of concurrency-safety problem behind connection pools and job-queue workers in backend systems.
- Added support for io_uring ATTACH_WQ so several rings can share an existing IO work queue, reducing per-connection kernel overhead relevant to high-concurrency API servers.

Other Experience

ZERO Labs Ltd

github.com/s3ndotxyz/runtime · 2024 – 2025

Co-Founder & Core Engineer

Remote

Tech: Rust, Intel SGX TEEs

- Co-designed and engineered Slipstream, a stateless backend runtime deployed inside Intel SGX Trusted Execution Environments (TEEs), in Rust, for confidential compute workloads.
- Designed high-throughput memory isolation interfaces between untrusted and trusted execution contexts with minimal overhead.

Thena.fi

02/2024 – 03/2024

Contract Backend Engineer

Remote

Tech: TypeScript, Postgres, Solidity

- Designed and shipped a greenfield wallet-based authentication protocol for the Arena product line.
- Diagnosed and resolved a critical performance regression on the frontend layer, measurably reducing user drop-off.

Technical Skills

Systems & Architecture: Rust, Zig, Go, WebAssembly, Intel SGX TEEs, Docker, Nix, NixOS (Linux), SQL, Postgres

Web & Tooling: TypeScript, Vue, Git, L^AT_EX

Spoken Languages: English (Native), German (Intermediate), French (Beginner)

Education

University of Benin

2024 – Present

Bachelor of Engineering (B.Eng.) in Mechatronics Engineering
